Model-2 Feature Extraction using VGG16 & ResNet50 Extract important image features using transfer learning with VGG16 and ResNet50.		

Project Description: (here you write what you did in this project (contribution) including Model Description

- In this module, we use two pre-trained deep learning models, VGG16 and ResNet50, for extracting important features from X-ray images.
- These models use Transfer Learning, which means we use knowledge learned from large existing image datasets.
- The preprocessed X-ray images are given as input to both VGG16 and ResNet50.
- The convolutional layers automatically identify important image characteristics such as edges, shapes, textures, and patterns.
- VGG16 extracts features using its sequential convolutional architecture, while ResNet50 uses residual connections for deeper feature learning.
- The extracted features are then forwarded to the classification stage to determine whether the X-ray represents a fractured or normal bone
